The heatmap displays the distribution of final temperatures over time. The y-axis represents temperature bins, and the x-axis represents the year. The color intensity indicates the frequency or count of observations within each bin for each year. The data shows a clear upward trend in temperature over the 46-year period, with a significant increase in the number of days reaching temperatures above 20°C in the later years.

Heatmap visualization showing the mean log(CPUE+1) (Y-axis) over time (X-axis, Year) for various fish species (rows). The color scale indicates the mean log(CPUE+1) values, ranging from 0.0 (dark purple) to 7.5 (yellow).

Mean log(CPUE+1)

Mean log(CPUE) by year and Final_Turbidity

A bar chart showing the relationship between Final_SalSurf ranges and Mean log(CPUE+1). The y-axis is labeled 'Mean log(CPUE+1)' and ranges from 0 to 4.5. The x-axis is labeled 'Final_SalSurf' and shows 16 ranges: [0,2], (2,4], (4,6], (6,8], (8,10], (10,12], (12,14], (14,16], (16,18], (18,20], (20,22], (22,24], (24,26], (26,28], (28,30], and (30,32]. The bars are dark blue. The values start at approximately 3.05 for [0,2], peak at approximately 4.3 for (2,4], and then generally decrease, ending near 0 for (30,32].
